Method:

The list of vowels was recorded three times by Scott Moisik. Each vowel was produced for approximately 2 seconds. The vowel spectra were obtained from 1 second windows positioned during the most stable portion of each vowel. Vowel formants were calculated using PRAAT over comparable ~1 second windows; averages of these were then obtained. Some manual measurement of F3 and especially F4 was necessary. The vowels were then recreated in VTL through manual adjustment of the free parameters in the context of the 'default' VTL anatomy (see Rick Janssen). The recreated vowels thus represent reasonable approximations based (primarily) on acoustic criteria. Images of the 2D VTL state are provided for reference and the VTL parameters are listed for each vowel. (Note: All formant values given in Hz.)
